

Governments can support mini-grids to achieve Sustainable Development Goal on energy access

Description

Governments should focus on mini-grids as a means to enabling access to reliable electricity for hundreds of millions of people that don't yet have it and mini-grids using solar and batteries have matured as a technology class, but financing such projects remains problematic, a new report has found. Around 789 million people worldwide still do not have access to electricity, which is the seventh of the international Sustainable Development Goals (SDG) adopted in 2015 at the UN Sustainable Development Summit.
